

Stam

Full-Stack Developer

Europe | stamsbusiness@gmail.com | github.com/Stamyyyyy | stam-console.web.app

SUMMARY

I build custom software end to end: desktop apps, Discord bots, and the web apps and databases behind them. I have delivered commissioned work for real clients and am looking for more people with real ideas who need someone who will actually finish the build.

SKILLS

Languages: JavaScript, Python, C, C++, HTML, CSS

Tools & frameworks: Electron, Three.js, Node.js, Firebase, Web Audio API, Git

Workflow: AI-assisted development, desktop packaging, automation, interface design

PROJECTS

Divisional Records Database (branded as Imperial Intelligence)

Commissioned developer -- live

A logistics and records-keeping database commissioned for a client's community project: personnel data, organizational hierarchy, and access-controlled records built to hold up under real, ongoing use.

Stack: JavaScript, Firebase (Auth + Firestore)

Frontline: Shattered Steel

Solo developer (own project) -- live

Discord bot and companion website for a Roblox WWII tactical warfare community: faction tracking, recruitment, staff tools, and campaign updates.

Stack: Python (Discord bot), JavaScript, Firebase

JARVIS Boot Intro

Solo developer -- desktop app

A fullscreen animated startup sequence for Windows: particle intro, typewriter boot log, and a synthesized startup sound generated live with the Web Audio API. Lives in the system tray and can launch at Windows login.

Stack: JavaScript, Three.js, Electron, Node.js

HOW I WORK

Scope agreed honestly up front, I own the whole build myself end to end, and I stick around after launch if something needs a fix. Currently open for new projects.
